

Cost Governance - Technical Implementation

Azure Cost Management

Budget alerts configured at 50%, 75%, 90%, 110% thresholds. Cost attribution using tag-based filters. Daily cost exports to data warehouse. Automated alert distribution.

Azure Policy (5 Policies)

1) Require resource tags - all resources must have 9 tags. 2) Limit VM sizes - prevent expensive SKUs. 3) Enforce network security groups - all VMs require NSG. 4) Auto-shutdown - dev/test VMs shutdown weekends. 5) Require CostCenter tag - all resources must have cost allocation tag.

VM Lifecycle Automation

Development: 7 PM weekday shutdown. Staging: Midnight shutdown. Production: Always-on, no auto-shutdown. Orphaned resource cleanup: 7-day warning, then auto-delete if no cost activity.

Orphaned Resource Detection

Daily scans identify: (1) Unattached managed disks, (2) Unused public IPs, (3) Unattached network interfaces. Alert if no cost activity in 30 days, no network traffic in 90 days.

Cost Anomaly Detection (5 Rules)

1) Day-over-day 20% spike. 2) Month-over-month 40% increase. 3) Unexplained service charges. 4) Underutilized reserved instances. 5) Abnormal storage growth.

Real-Time Dashboards (4)

1) Executive dashboard - total spend vs budget. 2) Team performance - per-team cost tracking. 3) Anomaly monitor - detected anomalies with investigation status. 4) RI & optimization - reserved instance utilization, rightsizing opportunities.

Incident Response

Anomalies detected within 30 minutes. Team leads notified via email + Teams. Investigation SLA: 24 hours. Remediation SLA: 48 hours for cost overruns.
